

Initial Specification: 5 GUI page in total

UI Requirement:

1. Users can register for a new account in the application.

The application should allow new users to store information in the database with a unique account.

2. Users can login with correct username and password.

For many users they like to keep a record of special and anniversary dates that are important to them so it is essential for these personal information to be encrypted as these are considered to be private to individuals.

3. Users are able to see saved events date counting in the main page.

As the main aim of my project, the event with countdown date should be shown in the center of

main page.

4. Users can add new event dates with title, target date and notification.

5. Users are allowed to edit event information which has already exist.
6. Users can update the same events for specified frequency.

The idea about this feature allows user to choose the frequency of repeating reminding (daily, weekly, monthly and annual). For example, to friend's birthday, an annual event is more convenient and efficacious.

7. Users can be notified before the event date coming.

Notification of events date make the project more interactive.
